HADOLINT — DOCKERFILE SECURITY & BEST PRACTICES

WHAT IS HADOLINT

Hadolint is a tool used to lint/check Dockerfiles.

It checks whether a Dockerfile follows Docker best practices and identifies potential problems before building the Docker image.

Hadolint checks a Dockerfile for errors, security issues, and best-practice violations before building the Docker image.

WHY DO WE USE HADOLIN

We use Hadolint to:

- Find mistakes in Dockerfiles
- Follow Docker best practices
- Improve Dockerfile quality
- Reduce unnecessary image layers
- Identify inefficient commands
- Detect potentially unsafe practices
- Catch problems before Docker image build

INSTALLATION OF HADOLINT

1.Download hadolint
wget -O hadolint https://github.com/hadolint/hadolint/releases/latest/download/hadolint-Linux-x86_64

2.Give Execute permission
chmod +x hadolint

3.Move it to /usr/local/bin
sudo mv hadolint /usr/local/bin/hadolint

4.Verify Installation
hadolint --version

HADOLINT JENKINS PIPELINE STAGE

```
stage('Dockerfile Lint') {
   steps {
      sh '''
         hadolint backend/Dockerfile
```

```
    '''
  }
}
```
