PRODUCTION-GRADE TERRAFORM REPOSITORY STRUCTURE

1. Terraform modules are reusable collections of terraform configuration files that help reduce code duplication, improve maintainability and standardize infrastructure provisioning.
2. In our project, the terraform repository is organized with a module's directory and separate environment directories for Dev, Stage and production.
3. Instead of writing the same terraform code repeatedly for resources such as VPC, EKS, IAM, security group, s3 and RDS we create reusable modules once and use them across multiple environments by passing different input variables.
4. Each environment (Dev, Stage and production) has its own configuration that calls these modules with environment-specific values, allowing us to reuse the same code while keeping the environments isolated.
