VIM EDITOR

VI Editor

1. Vi stands for Visual Interface
2. It is a classic text editor available in Unix systems
3. It is lightweight and fast
4. It has limited features compared to modern editors
5. Works in command mode and insert mode

VIM Editor

1. VIM stands for Vi Improved
2. It is an advanced version of Vi
3. It provides more powerful features like:
    - Syntax highlighting
    - Undo/redo multiple times
    - Search and replace
    - Plugins support
4. It is widely used in Linux systems
5. More user-friendly and flexible than Vi

VIM Has Four Modes

1. **Normal Mode**
   1.default mode when you open vim
   2.Used for navigation and commands
   3.Example
      1.dd -------> delete lines
      2.yy -------> copy lines

2. **Insert Mode**
   1.It is used to write & edit text
   2.you can type like a normal editor
   3.example:
      1.i ----------> insert before cursor
      2.a ----------> insert after cursor

3. **Command line Mode**
   1.It is used to run your commands
   2.Press esc and then : to enter these mode
   3.example:
      1. :w -------> save
      2. :q -------> quite
      3. :wq -----> save and quite

CLOUDBLITZ

4. **Visual Mode**
   1.used to select text
   2.works like selecting text with mouse
   3.example:
      1.v ----------> select character
      2.V ----------> select whole line

EDITORS IN LINUX

1. GUI based editors in windows --------> (notepad, msword)
2. GUI based editors in Linux ----------> (gedit, openoffice, kedit)
3. CLI based editors in Linux ----------> (vim, nano)

WAYS TO CREATE A FILE

1.touch ------> to create a empty file
2.cat ---------> to create a file with minimum data
3.vim --------> to create or edit the file
4.nano ------> create or edit a file (beginner friendly command)

To check vim
1.vim
  :q <enter>
