MARIADB DATABASE

what is data:

data is nothing but the information or the details about the reference.

MariaDB (MySQL):

MySQL database is a data structure that allows you to link the information between the different tables and different type of data buckets.

Database:

it is a collection of data but in a organize form called as database.

Database engine: -

1. mssql (Microsoft sql)
2. mysql
3. mariadb
4. postgresql
5. oracle
6. amazon arora
7. IBM db2

THERE ARE TWO TYPES OF DATABASES

1.sql (structured query language)

Static content-----> predefine schema------> Vertically scalable.

2.nosql (non structured query language)

Dynamic content -----> horizontally Scalable -----> not structured schema

PRACTICAL

1.yum install mariadb-server -y
2.systemctl start mariadb
4.set mariadb passwd
mysql_secure_installation
5.mysql -u root -h localhost -pmayur
6.show databases;
7.create database student_data;
8.use student_data;
9.create table student_info (name varchar (10), roll_no int, status varchar (10));
10.describe student_info;
11.show tables;
12.insert into student_info values ('user1',100,'fail');
13.insert into student_info values ('user2',101,'pass');

14.insert into student_info values (‘user3’,102,’fail’);
15.insert into student_info values (‘user4’.103,’pass’);
16.select * from student_info;
17.select name from student_info where status=’fail’;
18.select name, roll_no from student_info where status=’pass’
19.delete from student_info where name =’user1’
20.exit

To get the Backup:
mysqldump -u root -h localhost -pmayur student_data > abc.bkp

21.mysql -u root -h localhost -pmayur
22.use student_data;
23.drop table student_info;

To recover database:
mysql -u root -h localhost -pmayur student_data < abc.bkp

How to create user in the database:
24.mysql -u root -h localhost -pmayur
CREATE USER 'user1'@'localhost' IDENTIFIED BY 'Mayur@123';
GRANT ALL PRIVILEGES ON *.* TO 'user1'@'localhost';
FLUSH PRIVILEGES;

1.Backup of schema:
mysqldump -u root -h localhost -pmayur student_data --no-data > abc1.bkp

2.Backup of data:
mysqldump -u root -h localhost -pmayur student_data --no-create-info > abc2.bkp
