PACKAGE MANAGEMENT

Package management is the process of installing, updating, configuring, and removing software packages on a system in an organized and automated way.

Redhat Family
1.low level tool = rpm (redhat package manager)
2.high level tool = yum/dnf (yellowdog updater modifier)

Debian Family
1.low level tool = dpkg (Debian package)
2.high level tool = apt (advance package tool)

Common Package manager

1. RHEL/amazon linux/centos --------> yum/dnf (yellowdog Updater Modified)
2. ubuntu / Debian ----------> apt (advanced package tool)
3. openSUSE ----------> zypper
4. macos ----------> Homebrew

Example:
1. apt update
2. apt install apache2 -y
3. apt remove apache2
4. apt list --installed | grep apache2
5. apt autoremove

Note:
1. apt update ----------> to update the packages
2. apt install ----------> to install the webserver
3. apt remove ----------> to remove the package
4. apt list –installed -----> to check the installed packages
5. apt autoremove ------> to remove the unused dependencies
6. apt purge apache2 ---> to remove all related to package

2.To Remove the Package
1. apt remove apache2
2. apt autoremove
3. apt purge apache2
